* VBA This is an important feature for adding custom automation to existing objects. VBA is an acronym for Visual Basic for Applications. It is a programming language that provides the ability to automate virtually any aspect of Microsoft Office products. It is integrated with Microsoft Office and available as a component in all newer Microsoft Office applications. For example, in AutoCAD LT, the VBA programming language is used for macro commands and to add user interfaces and custom functions. It is based on Visual Basic, an object-oriented programming language created by Microsoft in 1990. VBA supports an object-oriented programming model. In other words, VBA does not support procedural programming. Procedural programming is a programming model where the programmer specifies how to perform a set of actions. VBA is a procedural programming language. To use VBA, users first need to create a VBA project. A project is a collection of objects, such as a module or a class, that represent a unit of functionality. You use a VBA project to group objects together that perform the same or similar tasks.

You can use VBA projects to share and reuse code and to automate processes. You can then create a class or module that contains all of your code and can be reused across multiple applications. The VBA IDE or Visual Basic editor runs in a Microsoft Windows operating system window and is activated by clicking on the Microsoft Office button. *.NET This language is used for working with programs written in languages such as Java or C++. The .NET framework allows developers to access the same functionality available in Visual Basic, Visual C++, and Java from the Microsoft Windows platform. .NET framework supports the C# programming language. * ObjectARX This is a C++ class library. It is the base for a large number of third-party AutoCAD-based products. 5b5f913d15
