Instead of wasting time for long .Pre-B-cell colony enhancing factor enhances B-cell receptor-induced apoptosis in mature B cells. Pre-B-cell colony enhancing factor (PBEF) is a pleiotropic cytokine that is constitutively expressed in B lymphocytes and shares structural homology with cardiotrophin-1. As an in vitro measure of B cell activation, murine spleen B cells were stimulated with anti- μ in the presence or absence of PBEF. Whereas PBEF alone did not induce apoptosis, it enhanced the sensitivity of B cells to B cell receptor (BCR) ligation-mediated apoptosis. Flow cytometric analysis with CD40 ligand treatment showed that PBEF enhances the BCR-induced B cell death in the absence of costimulation, whereas superantigen treatment still induces apoptosis by costimulating BCR in an additive manner. The apoptosis was associated with phosphatidylserine (PS) externalization and caspase-3 activation as well as cytochrome c release from mitochondria. Consistently, PBEF activated the caspases that are responsible for the apoptosis. Therefore, it appears that PBEF induces B cell death by activating the caspase cascades and PS externalization.Q: Getting a

Javascript Object I'm not exactly a front-end dev or JS developer, but I've just built this site for a client that uses it as a forum. Now, they want to be able to have a topic dedicated to a specific page, so when you go to that page it automatically creates a new topic. For now I had the page just create a new subject, but I had to make an Ajax call to be able to add the subject to the database so that it could be seen on the new topic page.
