What distinguishes Photoshop from other apps is its revolutionary user interface. Whenever you do something, Photoshop automatically presents you with an array of powerful, easy-to-use tools that

are key to the Photoshop experience. These tools can be found throughout the application and are context-aware--that is, they become available when you need them and disappear when you don't. You can also use them to perform a wide range of actions. Photoshop updates its tools nearly continuously, and you can use them to perform many sophisticated operations. They work the same way in all versions of Photoshop, but the the tools you will use within Photoshop all have their own particular benefits, so you will need to learn about them at your own pace. Various layers in Photoshop can be used in different ways. You can use more than one layer and blend them together to create a complex image with striking results. Layers also have special properties that can modify light, color, textures, and more. You can apply all kinds of special effects to layers, and that opens up a lot of creative possibilities. You may also use adjustment layers: these layers can be applied to images and adjusted with powerful tools you find when you change the context within which these tools operate. Some adjustment layers are preset, but you can create your own to make any adjustment you'd like. The tools you will use in Photoshop not only make the app work as you expect, but also change the way you think about your artwork. With each tool, you will perform the same actions repeatedly, but you can use them in a different way each time to get different results. And that's why Photoshop continues to be the most powerful and creative tool in the creative market.

Adobe's latest update for their Go Live app is something of a milestone in the graphic design world. Once a static and somewhat accidental creation, the Go Live app (now named Adobe Live) is a live-editing website that lets users make changes in real-time while multiple people are all simultaneously able to watch and provide feedback. Go Live is already used by a smattering of big name clients including WIRED, BBC World News, and the National Geographic Channel, but with this update—which adds improvements to the interface, including the ability to import project files and work with Adobe XD files in a designer's browser—it could become a more permanent feature. Typography is an integral part of any design, but creating typography that works smoothly across each individual typeface is difficult. Another challenge is making sure a new typeface looks like itself when you round the corners of letters. With new tools in the Text Effects section of Photoshop elements, you can easily change just the corners of a typeface, while simultaneously changing its style. In a similar vein, the Faces feature works by dividing up an image into a grid of 16×16 squares every time you change the style of a typeface, It allows you to change the overall appearance of a typeface and easily move it around the image or add it to a different typeface. You can then change the look of any single square by applying a different typeface or completely banish it. If you still find the process for applying new fonts daunting, you can forget it: on Photoshop you can also turn off all the automatic settings for fonts that you never use.

All of the editing and compositing features of Photoshop are designed to work together. The most common retouching apps use layers to layer multiple edits on top of each other, with the result seen onscreen. For example, you might want to correct an object, then follow up by applying a new background or lighting, then mask that new image, apply a burn or blur effect, then you can combine it with other image layers. When done, you can save the new image and continue editing as many times as you want. Photoshop is fast and highly-optimized for the latest features in computer hardware. We're continuing our coverage of the Virtual Human Interactions Conference, which was held in Amsterdam last week. Readers might recall that last year, we reported on how scientists from Amsterdam have developed a way to use motion capture to create a digital avatar and then control the virtual body with a joystick. There are over a dozen teams who are using virtual avatars and human controllers for remote experiments, and the video above gives a good sense of the possibilities.

In addition to the motion control work, we also recently covered the results of a Virtual Reality (VR) study, which found that VR can induce feelings of empathy and compassion in people. Now researchers are starting to use robots as human controllers and as tools to test the limits of emotions in VR environments, often using humans to do things robots can't do, like get up to a session's main stage and assist a talk to get picked up.
